14 Invariant mass distributions

15 Figures in this section represent 10% of all 2016 run data, more preciesly fils that have file number ending eith 0.

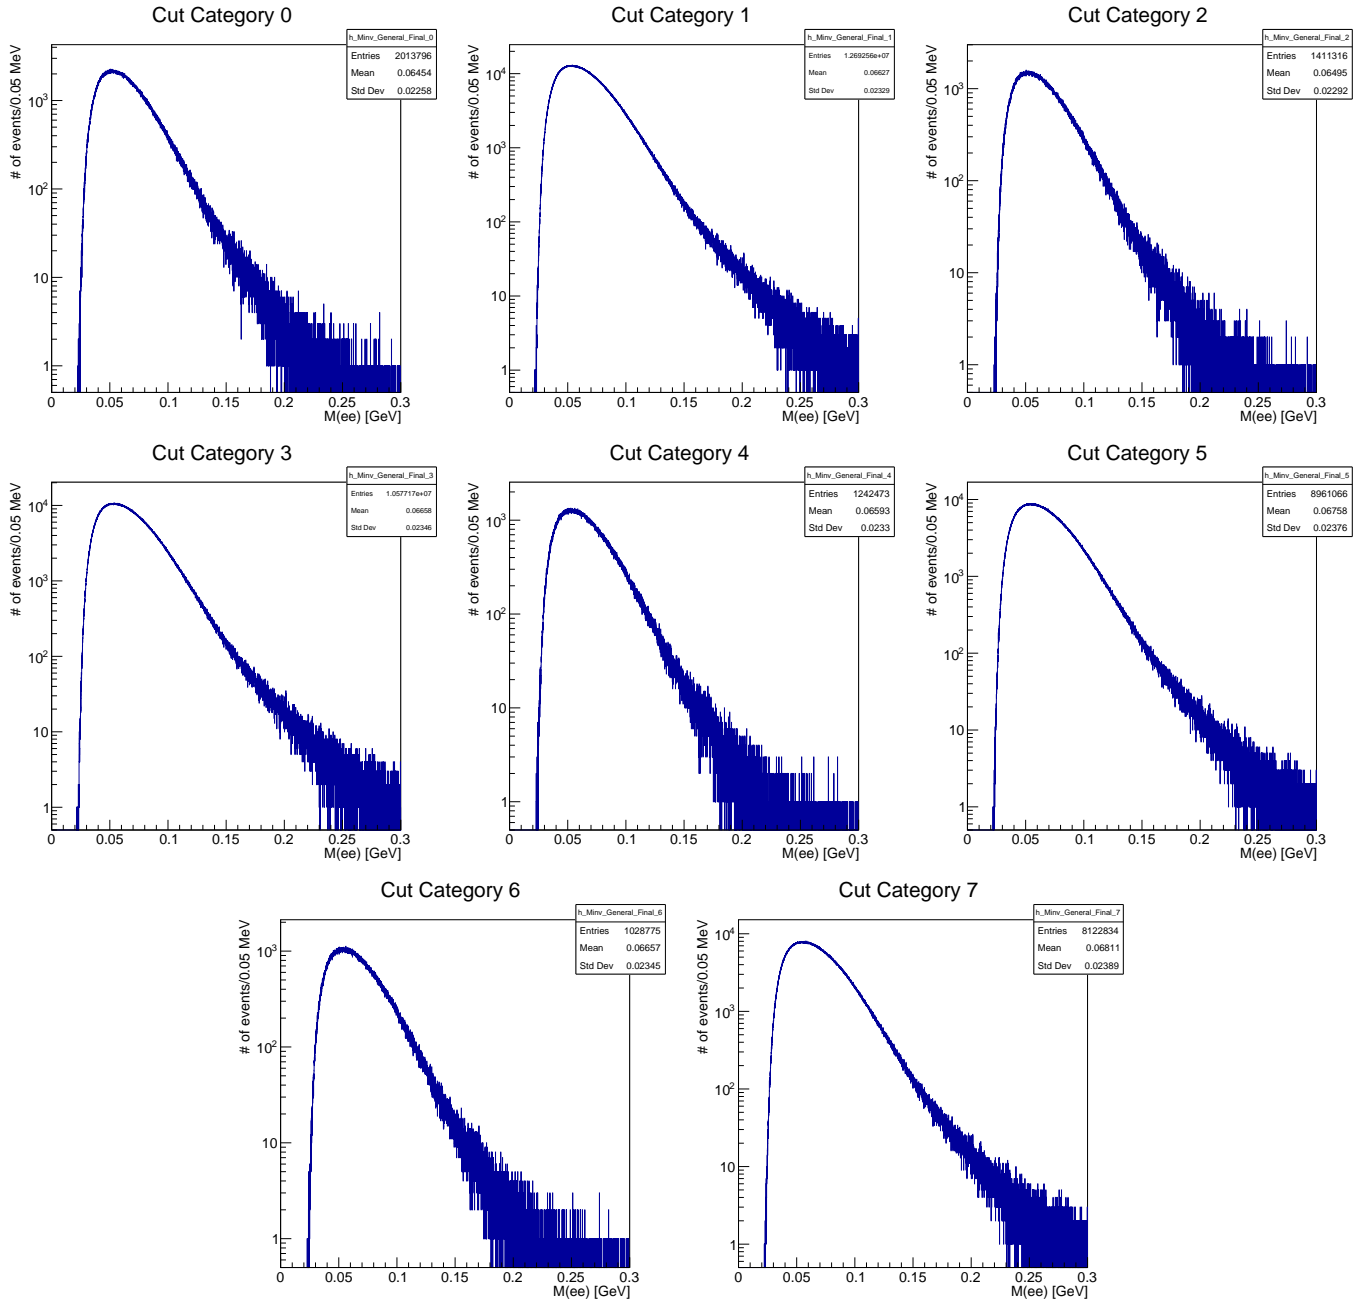

Figure 33: The mass distributions for difference cut categories. These figures represent the blinded 10% sample of rh 2016 Run.

17 Run By Run Variations

18 Note the Run 8043 is excluded from these plots, I think the luminosity is not properly calculated for
 19 this particular run. it's normalization is about $\times 4$ is off from the rest of runs.

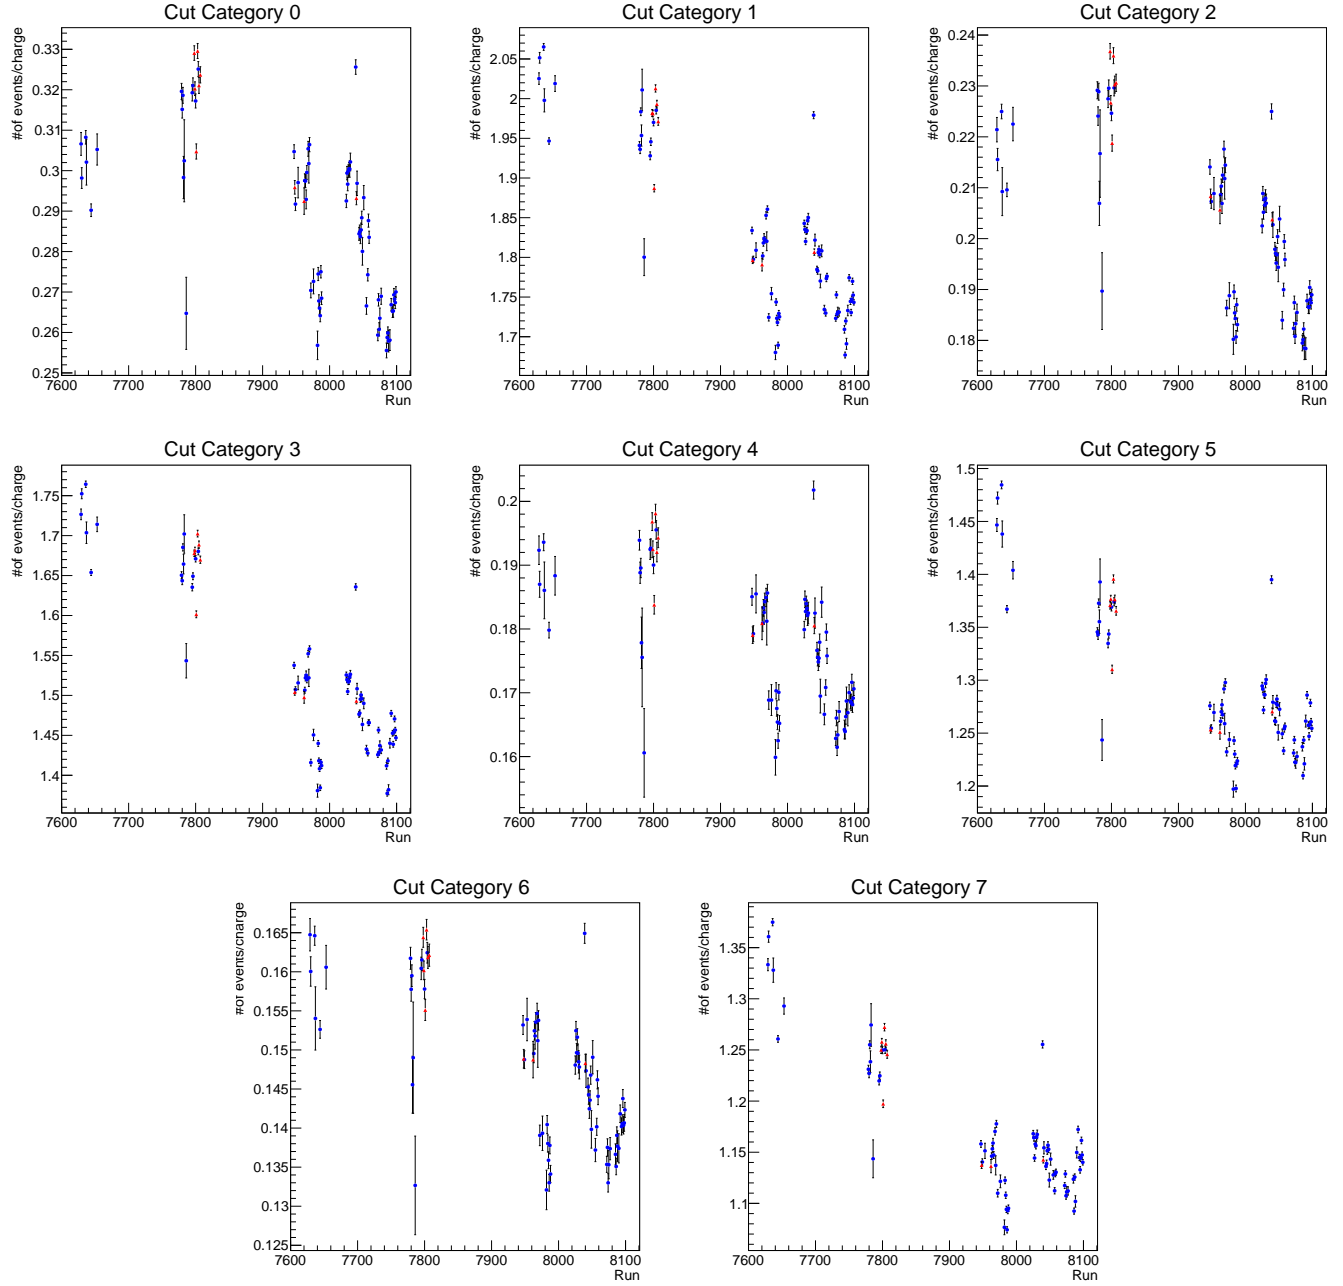

Figure 34: Integrated number of final events normalized by charge for different runs. different plots represent different cut categoried.
